

# The effect of the reproduction level

## Varying the reproduction level

Figures 1 to 5 show how the scenarios in our paper are affected by the choice of reproduction level. Here the reproduction level is set equal for all species to either 0.25, 0.45 or 0.65.

## What shall we plot?

We have to decide whether we want to plot biomass or yield and whether we want percentage change or absolute values. Figures 6 to 10 show what the various plots will look like with a reproduction level of 0.65.
